ANNEX 3: DEMAND DRIVERS

The main factors influencing demand growth considered were demography, GDP growth, Specific Vision 2030 Flagship projects, E-cooking, and Electric vehicles.

Demography

Historically, population size and urbanization rate have shown a positive correlation with electricity usage. As shown below, domestic commercial (DC), small commercial SC), and street lighting (SL) show positive correlations with population growth. This correlation is used to perform trend analysis in estimating future electricity demand within the named classes.

The demand for more electricity is mainly due to economic activities and household needs. Currently, the inadequacy of individual consumer data makes forecasting power demand a challenge, thus requiring the utilization of aggregated data for system load predictions. Population growth and urbanization are essential elements to the demand rise, as is the growth of GDP, which has an immediate result on household earnings and thus electrical consumption. Additionally, key government priority projects through the Bottom-up Economic Transformation Agenda (BETA) and Vision 2030 flagship projects have a bearing on GDP growth in both the reference and high scenarios.

The methodology used to undertake the forecast is similar to that used in the previous updates of the LCPDP plans. The methodology follows Model for Analysis of Energy Demand (MAED) principles for the domestic consumers, whereby a simple correlation factor between GDP growth and consumption for the commercial & industrial consumers and a correlation between street lighting consumers and domestic consumers is formulated. A regression analysis using the past seven years' records of GDP and large power consumption, shows that a 100% increase in GDP results into approximately 47% increase in large power consumption.

The demand forecasting model considers this correlation to perform trend analysis in estimation of future electricity demand within these classes. Historically, population size and urbanization rate have shown a positive correlation with electricity usage in Domestic, small commercial and street lighting customer categories as shown in figure 1 below.

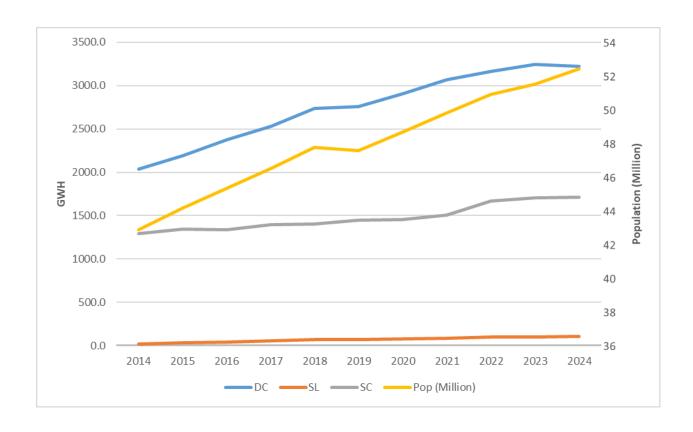

Figure 3-1; Historical trend between SC, DC, SL and Population

Domestic Consumption

In the past decade, domestic connections has significantly increased; however, annual specific consumption has declined from 819kWh in 2014/15 to 351kWh in 2023/24 as shown in the table below. The decrease is due to two factors: universal electricity access leading to more low-income households being connected yet they consumer less power, and advancements in energy-efficient appliances and electronics.

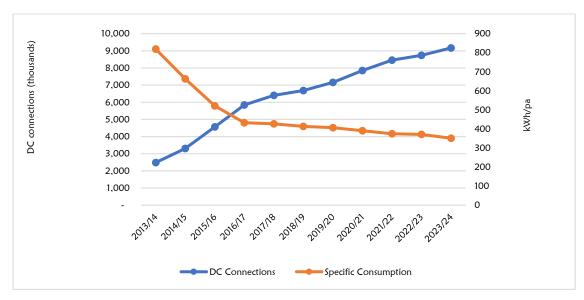

Figure 3-21; Historical trend between SC, DC, SL and Population

An analysis of power demand as a result of e-mobility and e-cooking was undertaken to assess the impact on overall future electricity demand.

E-Mobility

Kenya's electric vehicle (EV) sector is steadily progressing, supported by favourable government policies, expanding charging infrastructure, and rising public awareness of environmental and economic benefits. To support the government initiatives, Kenya Power and Lighting Company (KPLC) has introduced a special tariff for this category of consumers, offering off-peak rates for those connected under the tariff categories CI1-CI5. The sector also plays a significant role in the country's energy transition and Vision 2030 goals especially in reducing greenhouse gas (GHG) emissions and enhancing energy security. According to National E-Mobility Policy Kenya, 2024, road transport accounts for 94% of transport emissions. The National Climate Change Action Plan (NCCAP) 2023-2027 identifies the uptake of EVs as one of the climate actions in the transport and energy sectors as they significantly cut CO2 emissions, improve energy efficiency, and build a clean transport network.

According to the bi-annual EPRA statistic report 2024/25, cumulative number of registered EVs stood at 5,294 as of December 2024, a rise from 3,753 registered in 2023. The growth is attributed to various government initiatives such as introduction of special electric mobility tariff of 16 Kshs/kWh, reduction in excise duty on electric vehicles from 20% to 10%, exemption of fully electric cars from VAT, the expansion of charging infrastructure, and declaration by the Kenyan government to the COP26 to transition to 100% zero-emission cars by 2035. Besides, according to National Energy Efficiency and Conservation Strategy 2020, 5% of the target newly registered vehicles will be EVs by 2030. With all these initiatives, it is expected that the level of EV's adoption in Kenya will increase substantially. It is therefore expected that modelling the demand for EVs will be improved as more data becomes available. Using the projections in the MTP 2025-2029, electricity demand from EVs is expected to increase from 23.51MW in 2024 to 219.2MW and 273MW in 2030 for both reference and vision scenarios and subsequently to 397.87MW in 2044, assuming a growth rate of 4.35%.

E- cooking

According to Kenya National e-Cooking Baseline Study Report 2023 done by Nuvoni, 0.58% of the population who own electric appliances primarily use electric appliances for cooking while 3.9% of households use these appliances for cooking, reheating food and preparing beverages. Ownership and usage of the appliance is influenced by gender, wealth, and urban-rural divide. Besides, 74.6% of the Kenyan households, believed that traditionally cooked food tastes better. Kenya aims to achieve 100% access to clean cooking by 2028, a strategy that is aligned with Sustainable Development Goal 7 (SDG7). The milestone also aligns with reducing deforestation, indoor air pollution, and greenhouse gas emissions.

An assessment of the transition to e-cooking was conducted, focusing on a typical residential customer. Currently, 0.58% of the household primarily rely on electricity for cooking. Projected demand growth attributed to e-cooking is anticipated to be 10% by 2028, according to the Kenya National Cooking Transition Strategy (2024-2028) which outlines a five-year plan to establish a sustainable eCooking marketing place. The value will be escalated to 15% by 2030. Further, a diversity factor of 22% from a study done in Malawi, was employed to account for the variation in uses of the appliance. The estimated demand of 1.16MW in 2024 is projected to increase to 28.2MW and 37.43MW by 2029 and 38.57 MW by 2030 and 141.14 MW by 2044 for reference and vision scenario, respectively.

Government Priority areas

Electricity demand in Kenya is expected to grow steadily in the coming years driven by various government-led development initiatives that aim to transform and sustain the economy. Strategic programs target housing, industrialization, digitalization, and energy transition, which intend to significantly increase Kenya's energy consumption.

- a. Affordable housing and urban development: as per the National Housing Corporation Strategic Plan 2023-2027, the Kenyan government has identified housing as one of its development priorities and targets to facilitate the construction of at least 1,000,000 affordable houses by 2027.
- b. Industrialization and MSME Growth: MTP IV has proposed a 5.9% annual industrial growth by 2027.
- c. Digital superhighway and creative economy: the Kenya National Digital Master Plan 2022-2032 aims at expanding Kenya's fibre network coverage countrywide by connecting 100,000 KM of fibre optic cable to provide internet to schools, government institutions/offices, health facilities, and public spaces among others. The facilities will require electricity to support data centers and ICT operations. Coupled with the Last Mile connectivity program, this effort will empower the creative digital sectors while reducing the digital divide.
- d. Green Energy Transition and Electric Cooking: Kenya is accelerating its shift towards clean energy, focusing on electric mobility and electric cooking. These trends underscore the need for grid expansion and investment in green infrastructure.
- e. Social services and healthcare: the Universal Health Coverage initiative indirectly increases electricity demand through hospitals and clinics construction and upgrades. Increased use of medical equipment especially in rural areas connected through the Last Mile Connectivity program will contribute towards rising energy needs.
- f. Green hydrogen development: Kenya has positioned itself as a pioneer in green hydrogen, a clean energy carrier capable of transforming energy storage and transport. In a major step, Kenya has published a Green Hydrogen Strategy and Roadmap and Guidelines on Green Hydrogen and its Derivatives in September 2023 and May 2024 respectively. Green hydrogen policy framework is also underway. A notable project includes the development of a geothermal-powered green hydrogen plant to produce green ammonia for local fertilizer manufacturing, reducing fossil reliance and boosting energy innovation.

2025 Budget Policy Statement

The 2025 BPS is built on the Government's Bottom-Up Economic Transformation Agenda with a strong emphasis on inclusive green growth. This approach recognizes the energy sector as a foundational enabler for economic transformation, job creation, and sustainable development. The energy agenda is aligned with the national goals such as reducing the cost of living, supporting manufacturing, expanding infrastructure, and transitioning to clean energy. Some of the proposals in the BPS that will influence energy consumption include the following

- a. expansion of electricity generation and access: the government plans to connect 1.44 million new electricity customers and 1,080 public facilities and develop infrastructure to enhance energy resilience and meet the growing electricity demand, especially in industrial, residential, and institutional sectors.
- b. Green energy and E-mobility Transition: BPS promotes clean energy technologies by installing solar PV systems, promote clean cooking technologies and energy-efficient appliances, expand energy centers to all counties, and electrify schools, boreholes, and public institutions. BPS also highlights E-mobility as a key intervention to reduce emissions and fuel dependence. In collaboration with BasiGo and Kenya Vehicle Manufacturers (KVM), the Kenyan government

- has begun a local assembly of electric buses, aiming for 1,000 units over three years. The aim is to support the target of a fully electric bus fleet by 2027.
- c. Green Hydrogen and climate adaptation: Kenya is developing green hydrogen strategy to leverage excess renewable energy for hydrogen and ammonia production and support fertilizer production and export capability. Climate resilience and emission reduction is also key in the document with the ongoing integration of climate data and environmental accounting into economic planning.
- d. Infrastructure for economic growth: infrastructure expansion includes electrification of transport (Bus Rapid Transit and Mass Rapid Transit System) using electric vehicle buses signaling a demand shift in electricity usage towards public transit systems. Cooling demand from new data centers and creative digital economy also contributes to the projected rise in electricity consumption.

ANNEX 4: DEMAND FORECAST RESULTS

Table 4-1: Peak Demand Forecast Results.

| Year | Reference (MW) | Vision (MW) | Low (MW) |
|---------------------|----------------|-------------|----------|
| 2024 | 2,288 | 2,288 | 2,288 |

ANNEX 8: CLIMATE RISK MATRIX

Table 8-1: Climate Risk Matrix

| No. | Risk | Cause | Impact | Risk Rating | Proposed Mitigation / Action Plan |
|-----|--|--|---|-------------|---|
| 1 | Substation damage due to flooding | Heavy rainfall, river overflow | Equipment failure, power outages, prolonged downtime | High | - Site substations on higher ground or use raised platforms - Install flood barriers and drainage systems - Climate risk screening in design stage |
| 2 | Tower collapse due to high winds | Storms, cyclones | Structural failure, transmission line outage | High | - Use wind resistant tower designs - Strengthen foundations - GIS wind hazard mapping during planning |
| 3 | Wildfire damage to transmission lines | Drought, high temperatures, bushfires | Weakening of components, collapse of towers, service interruption | Medium | Use fire resistant structures Maintain firebreaks around ROWs Monitor fire risks seasonally as per the fire calendar Ensure regular vegetation management |
| 4 | Heat stress on equipment | Extreme heat | Reduced equipment efficiency, increased maintenance costs, reduced ampacity | Medium | - Use heat rated equipment - Improve ventilation and cooling in substations - Use conductors resistant to extreme heat |
| 5 | Soil erosion around towers | Intense rainfall, poor land cover | Tower instability, risk of collapse | High | - Reinforce tower bases - Use vegetation or geotextile erosion control - Implement catchment restoration near ROWs |
| 6 | Accessibility challenges during disasters | Flooding or landslides on access roads | Delay in maintenance or emergency response | Medium | Climate proof critical access roads Maintain emergency response kits for rapid fault detection Collaborate with agencies with rapid response such as Kenya Police and DoD |
| 7 | Lightning damage to lines and substations | Increased storm frequency | Equipment burnout, blackouts | Medium | - Install advanced surge arrestors and grounding systems - Upgrade lightning protection systems |

| No. | Risk Description | Cause | Impact | Risk Rating | Proposed Mitigation / Action Plan |
|-----|---|--------------------------------|--|-------------|--|
| 8 | Reduced system reliability due to climate uncertainty | Unpredictable weather patterns | Difficulty planning load and maintenance schedules | Medium | Integrate climate risk assessment early project panning Invest in digital monitoring and adaptive protection systems to enhance early warning |

ANNEX 9: CLIMATE FINANCE AND CARBON MARKET POTENTIAL FOR KEY TRANSMISSION PROJECTS

Table 9-1: Climate Finance and Carbon Market Potential For Key Transmission Projects

| Project | Climate Rationale | Carbon Project Potential | Climate Finance Type |
|---|--|-------------------------------|-------------------------|
| LILO – Loosuk | Evacuation of Geothermal and wind energy to western Kenya; Reinforcement of the grid | High – Wind integration | Mitigation+ Adaptation |
| STATCOMs | Enables stable integration of large-scale wind and geothermal power by providing dynamic voltage control at a key national grid hub. Enhances voltage stability and reactive power support in the coastal network, improving power quality for critical industrial and port infrastructure. | Efficiency and RE Integration | Mitigation + adaptation |
| 132kV Menengai – Olkalou – Rumuruti | Geothermal evacuation from Menengai | High – Renewable energy | Mitigation |
| 145km 220kV Kiambere – Maua – Isiolo 220kV | Evacuation of hydropower from Kiambere and enhancing system stability | High – Renewable + resilience | Mitigation + adaptation |
| 220kV Garissa – Habaswein – Dadaab | Enhanced access in Northern Kenya; enables thermal phase-out | High – Clean access | Mitigation + adaptation |
| 132kV Wajir – Mandera / Link to Ethiopia | Enhances clean power access; reduces diesel reliance | High – Clean access | Mitigation + adaptation |
| Olkaria IX – Longonot 220kV | Geothermal evacuation | High – Renewable integration | Mitigation+ Adaptation |

| Project | Climate Rationale | Carbon Project Potential | Climate Finance Type |
|---|---|----------------------------------|-------------------------|
| Agil 220kV Evacuation | Evacuation of new geothermal resource | High – Renewable integration | Mitigation |
| Agil – Olkaria IX 220kV | Strengthens geothermal transmission corridor | High – Renewable integration | Mitigation |
| Rongai – Kilgoris 400kV | Lake Victoria Ring; regional system efficiency and interconnectivity | High – Efficiency and resilience | Mitigation + adaptation |
| NPP TI 1 and 2 | Evacuation of nuclear power; system baseload enhancement | High – Clean integration | Mitigation + adaptation |
| 220kV Kisumu (Kibos) – Kakamega (Musaga) | Transmission efficiency in Western Kenya; reduces losses; reinforcement of grid | Moderate | Mitigation+ adaptatoin |
| 220kV Rongai – Keringet – Chemosit | Transmission efficiency; supports low- emission development | Moderate | Mitigation |
| Conductor Stringing on KPTSIP Lines | Enhances redundancy; reduces losses | Moderate – Efficiency | Mitigation |
| 220kV Marsabit – Moyale | Improved access and thermal reliance reduction | Moderate | Mitigation+ Adaptation |
| Longonot Substation + Gilgil LILO | Improves power flow and stability | Moderate – Efficiency | Mitigation+ Adaptation |
| Rangala – Bondo 132kV | Strengthens regional grid reliability | Moderate – Efficiency | Mitigation+ adaptation |
| Mariakani – DongoKundu 400kV | Enhances coastal grid reliability and resilience | Moderate – Efficiency | Mitigation+ Adaptation |
| Kwale Sugar – Titanium Reconductoring | Increases power flow to industrial loads | Moderate – Efficiency | Mitigation+ Adaptation |

| Project | Climate Rationale | Carbon Project Potential | Climate Finance Type |
|---------|--|--------------------------|-------------------------|
| • | Enhances capacity in Western region grid | Moderate – Efficiency | Mitigation+ adaptation |
| 8 | Improves border connectivity and supports regional trade | Moderate – Efficiency | Mitigation+ adaptation |
| | Enhances reliability and resilience of northern region | Moderate – Resilience | Adaptation + mitigation |
| ` , | Power quality improvement in underserved Eastern region | Moderate – Efficiency | Mitigation |
| | System reliability improvement in Nairobi | Moderate – Efficiency | Mitigation |
| | Reinforces grid in climate-sensitive region | Moderate – Resilience | Adaptation + mitigation |

ANNEX 10: RISK AND MITIGATION MATRIX

Table 10-1: Risk and Mitigation Matrix

| NO. | Risk Description | Cause | Impact | Risk | Proposed Mitigation/Action Plan | Risk Owner |
|-----|--|--|---|----------------|--|------------------------------|
| 1 | Risk of potential threats or challenges that arises from deficiencies or weaknesses in governance structures, processes, or practices. | Changes in the company governance structure Political instability, economic downturns and shifting government priorities which affect the implementation of the plan. Geopolitical tensions. | Delays in projects implementation and cost over runs Compromised project quality. Reputational damage Supply chain disruptions. Security threats to the transmission infrastructure | Rating High | Continuous stakeholder engagement. Strengthening oversight controls to closely monitor implementation of the plan. Close monitoring of geopolitical developments. Continuous engagement with CIPU to enhance power infrastructure security. | CS, GM- LEGAL SERVICES |
| 2. | Operational Risks Risk of failures or disruptions in information technology systems or transmission infrastructure. Risk of deficiencies in internal processes and procedures | Supply chain Disruptions resulting to delays or shortages affecting project timelines. Grid instability due to inadequate transmission capacity of some of the transmission lines. | Project implementation delays and cost overruns. Reduced grid reliability and stability as a result of delay in transmission and | High | Leverage on technical expertise by collaborations to explore emerging technologies, best practices and innovative solutions for optimizing the transmission infrastructure. Maintain buffer stocks for critical materials. | ALL HODs |

| NO. | Risk Description | Cause | Impact | Risk Rating | Proposed Mitigation/Action Plan | Risk Owner |
|-----|---|--|---|----------------|--|---------------|
| | | Theft and Vandalism of Transmission infrastructure. Equipment failure due to unexpected malfunctions resulting to network disruptions. Extreme weather events such as flash floods, river floods and strong winds hindering maintenance activities. Relate the risk of internal processes and procedures with a cause. | transformation implementation. Possible loss of transmission network Loss of revenue and unplanned costs of spares. Reputation damage • | | Conduct a risk assessment and implement disaster management framework. Enhance security system and operations • | |
| 3. | Project Risks Inability to complete projects within the required scope, time and quality. | Delays in acquisition of right of way Expansion and Design changes from the original plan within the life of the projects. Communication challenges between new and existing equipment due to differences/changes in technology. Lengthy procurement processes and contracts non-performance. Inadequate risk assessments exposing the projects to unforeseen risks and uncertainties. | Increased project costs and delays in project completion. Unrealised Wheeling Revenue. Lack of access to project sites. Legal suits and costs Reputational damage | High | Monitor procurement performance, delivery timelines and contractual obligations to mitigate procurement risks. Ensure the standards and specifications for the new or upgrade equipment are compatible with the existing equipment. Develop and implement a project management framework. Evaluate project resource availability, skills and expertise requirements and develop contingency plans for resource shortages. Effective communication, collaboration | GM-D&C |

| NO. | Risk Description | Cause | Impact | Risk Rating | Proposed Mitigation/Action Plan | Risk Owner |
|-----|--|---|---|----------------|---|----------------|
| | | Stakeholder resistance or conflicts affecting project alignment and execution due to diverging interest, expectations and insufficient stakeholder involvement. Under-performance of contractors. | | | engagement between all the project stakeholders throughout the project lifecycle. | |
| 4. | Financial Resilience - It encompasses all risks financial in nature including but not limited to Liquidity and cashflow risks. Risk arising out of financial operations. | Overreliance on exchequer funding Overreliance on uncertain donor financing Inadequate funding for projects. Exchange rate fluctuations Budget Constraints Delayed disbursement of funds from National Treasury. Misalignment between budgetary allocation and disbursement | Incomplete projects/Delays in project implementation. Unexpected increases in project costs affecting financial viability. Reputational damage. | High | Continuous engagement with the NT for early disbursements of funds. Consider hedging strategies to cushion the company on adverse FX fluctuations. Explore revenue diversification sources to reduce over reliance on exchequer. Implement a monitoring and evaluation system that helps in providing realtime reports on actual disbursements and budgeted allocations. | GM- FINANCE |
| 5. | Technology Risks These are technologically oriented risk and refers to all issues of information and Communication technology | Obsolescence of equipment due to new emerging technologies, exposing the network to potential attacks (Technical Vulnerabilities) Cyber security threats compromising systems | due to unauthorized access and data breaches. | High | Conduct regular technology audits and vulnerability tests to identify outdated systems and potential vulnerabilities. Update Business Continuity plans, ICT Disaster Recovery plans and testing. | GM-SRC |

| NO. | Risk Description | Cause | Impact | Risk | Proposed Mitigation/Action | Risk |
|-----|---|--|--|--------|---|--|
| | | integrity and data security. Lack of a fully featured test environment and documentation of the recovery and continuity processes. Lack of systems replication or offsite backup to offer failover Lack of integration between systems. | Incompatibility between different systems resulting to inefficiencies. | Rating | Implement robust cyber security measures to safeguard the systems against cyber threats and data breaches. Develop comprehensive backup and recovery strategies to minimize data loss in case of system failures. Training and capacity building for all staff to ensure efficient system operations. Collaboration with technical experts for guidance on emerging trends and best practices. | Owner |
| 6. | Legal and Compliance Risks Noncompliance to existing laws/ regulations and other statutory requirements Inadequacies in contract management/Breach of Contract by third parties Inability to effectively acquire land and right of way for projects. | Complexities in Land acquisition and right of way for transmission infrastructure Inadequate contract management processes. Contractual ambiguity and non-performance by contractors. Knowledge gaps in application of financial standards and regulations (IFRS, PFM Act, IPSAS, NT Circulars, etc) | Legal Disputes and increased litigation costs. Delays in Project implementation. Cost overruns Reputational damage Increases in contingent liabilities | High | Monitor performance metrics, milestones and remedies for non-performance to ensure accountability and project continuity. Training project staff on contracts management. Monitoring of contact implementation during the project lifecycle. Regular assessment on project staff knowledge of financial standards through regular simulations and assessments. | CS, GM- LEGAL SERVICES GM-SRC |

| NO. | Risk Description | Cause | Impact | Risk | Proposed Mitigation/Action | Risk |
|-----|---|--|--|--------------|---|----------|
| | - | | • | Rating | Plan | Owner |
| 7. | Health and Safety Risks Potential hazards to staff/contractors and the public by accidents or incidents involving high voltage transmission installations. | Non-Compliance to safety standards and contract provisions. Inadequate enforcement of Contractual obligations. Inadequate safety equipment. Excessive Workload | Public opposition to transmission projects due to safety concerns may derail or delay the project implementation. Injuries, illnesses and fatalities among employees and contractors. Increased insurance costs for the company and potential legal liabilities. | High | Routine project site audits and routine risk assessments to identify potential hazards and implement corrective actions proactively. Regularly review and update the safety policies and procedures to ensure compliance with industry standards and regulations. Implement emergency response plans and train staff and contractors to ensure a prompt response in case of emergencies. Activate the incident management plan. Community engagement and outreach with local communities to raise awareness on health and safety risks associated with the transmission infrastructure. | GM-SOPM |
| 8. | New and Emerging Risks (Reword the risk description) A risk that is evolving in areas and ways where the body of available knowledge is weak. | Climate Change impacts leading to extreme weather events and grid vulnerabilities. Disruptive Technologies: Rapid advancements | Damage of transmission lines, towers and substations resulting to power outages and disruptions. | High Risk | Climate Resilience planning by conducting vulnerability assessments and developing adaptation strategies. Developing emergency response plans and contingency measures to mitigate the impact of climate related disasters on | All HoDs |

| NO. | Risk Description | Cause | Impact | Risk Rating | Proposed Mitigation/Action Plan | Risk Owner |
|-----|------------------|---|--------|----------------|--|---------------|
| | | in AI, blockchain, and other technologies. • Geopolitical Instability: Political unrest and changes in international relations • Supply chain disruptions | | | the transmission infrastructure. Collaborating with sector stakeholders and local communities to raise awareness and implement climate resilient practices. Horizon scanning-Regularly monitor global trends and developments to identify potential risks early. | |

ANNEX 11: LOG FRAME FOR MONITORING EVALUATION ACCOUNTABILITY AND LEARNING (MEAL)

Table 11-1: Log Frame for MEAL

| PDO Level Results Indicators | Data Source/ Methodology | Means of Verification | Risks/ Assumptions |
|---|--|--|---|
| Impact indicator one % rate of improved access rate | KETRACO & KPLC | KPLC annual reports, National Electrification Database | Assumes increased grid capacity translates to wider household and industrial access |
| Impact Indicator two Number of upcoming county and national development plans indicating increased power demand | County & national development plans | Official county plans, MoEP updates, CIDPs | Assumes timely review of plans; power access recognized as a planning priority |
| Impact indicator three Number of new middle and large power consumers | KPLC consumer registry, County Trade departments | KPLC customer database, signed service agreements, county investment records | Assuming economic conditions support industrial expansion |
| Impact indicator four % increase in the capacity expansion among middle and large power consumers | KPLC consumption data, industry self-reports | KPLC metering data, plant capacity declarations | Assumes reliable reporting and stable demand growth. |
| Outcome indicator one Reduction in frequency of power outages | Reports from KPLC Control Centre, consumer feedback | SCADA logs, outage analytics reports, feedback logs from consumers | Assumes full operationalization of new lines and accurate data logging |
| Outcome inductor two Reduction in duration of power outages | Reports from KPLC Control Centre, consumer feedback | System downtime logs, Consumer complaints data | Assumes improved maintenance and fault response |
| Outcome indicator three Reduction in diesel fuel use | Energy cost and fuel use reports from consumers | Purchase receipts, plant logs, cost tracking forms | Assumes truthful reporting and willingness of industries to share data |

| Outcome indicator four Increased electricity consumption | Reports from National Control Centre (KPLC) & large power consumers KPLC load profiles, billing data | Smart meter readings, National Energy audit reports | Assuming demand increase is attributable to grid improvements |
|--|--|---|---|
| Output indicator five length (km) of transmission lines constructed | Reports from KETRACO, REA & KPLC | Completion certificates, inspection reports | Assuming timely construction and reporting |
| % share of lines completed annually | Annual implementation reports | Progress tracking sheets, MTP reports | Assumes annual planning and construction are synchronized |
| Output indicator one Number of new substations constructed and transformation capacity (MVA) | Reports from KETRACO & KPLC | Commissioning reports, GIS data | Assuming availability of funding and equipment |
| Output indicator two MW capacity of green energy added | Reports from KETRACO, KenGen & GDC | Interconnection agreements, dispatch records | Assumes timely generation project completion |
| Input indicator three Finances disbursed for constructions | KETRACO finance systems | Financial disbursement reports, audit records | Assuming transparent financial management |

ANNEX 12: SUMMARY TRANSMISSION LINES PROJECT AS AT JUNE 2025

Table 12-1: Summary of Planned Transmission Projects

| YEA R | TRANSMISS | SION LINE | VOLTA GE (KV) | LINE LENG | DESCRIPTION/REM ARKS | OBJECTIVE OF THE PROJECT |
|----------|-----------|-----------|------------------|--------------|--|---|
| K | FROM | ТО | GE (II) | TH (KM) | AKKS | THETROJECT |
| YEAR | 2025 | | | | | |
| 2025 | MARIAKANI | ISINYA | 400 | - | Part of Mombasa-Nairobi; Energization/Operation at 400kV. Construction of 400/220kV substation at Mariakani 4x200MVA 400/220kV transformers. Relocation of 2x100MVAr reactors each to Isinya (from Embakasi) and to Mariakani (from Rabai) | Increase transmission capacity between Mombasa and Nairobi to boost power supply in the interconnected system through supply of thermal power generated at the coast |
| 2025 | KITUI | WOTE | 132 | 66 | 66km 132kV Kitui- Wote TL. 1x23 MVA 132/33kV substations at Kitui and Wote | Extend transmission and reinforce distribution network - improve national access to electricity, upgrade voltage to improve supply quality, reduce system losses and increase system reliability. |

| YEA R | TRANSMISS | SION LINE | VOLTA GE (KV) | LINE LENG | DESCRIPTION/REM ARKS | OBJECTIVE OF THE PROJECT |
|----------|-----------|-------------|------------------|--------------|---|---|
| K | FROM | ТО | GE (KV) | TH (KM) | AKKS | THE PROJECT |
| 2025 | NANYUKI | RUMURUTI | 132 | 79 | 79km 132kV Nanyuki-Rumuruti TL, 132/33kV 1x23MVA SS at Rumuruti and 132kV bay extension at Nanyuki. | Extend transmission and reinforce distribution network - improve national access to electricity, upgrade voltage to improve supply quality, reduce system losses and increase system reliability. |
| 2025 | NANYUKI | ISIOLO | 132 | 70 | 70km 132kV Nanyuki- Isiolo TL, 132/33kV SS at Rumuruti and 132kV bay extension at Nanyuki. Part of the scope is 5 km UG cable. | Extend transmission and reinforce transmission network - system reliability and security. |
| 2025 | ISINYA | KONZA | 400 | 45 | Isinya-Konza 45km of 400KV D/circuit transmission line and bay extension at Konza and Isinya substations including step down to 66kV and 132kV intertie between Konza 400/132kV and Konza 132/33kV. | Part of 400kV ring - Improve reliability and ensure security of supply in the 400kV backbone. |
| 2025 | RABAI | NEW BAMBURI | 132 | 17 | 17km, 132kV double circuit line with 132kV bay extension at Rabai, New Bamburi. | Improve reliability and security of supply. Increase access, and connectivity |

| YEA R | TRANSMISS | SION LINE | VOLTA GE (KV) | LINE LENG | DESCRIPTION/REM ARKS | OBJECTIVE OF |
|----------|------------------------|-----------|------------------|--------------|---|---|
| K | FROM | ТО | GE (KV) | TH (KM) | AKKS | THE PROJECT |
| | | | | | Converting the sections of the existing TL currently on wooden poles to steel lattice tower. | through reinforcement of transmission grid. |
| 2025 | NEW BAMBURI | BOMANI | 132 | 11 | 10km, 132kV double circuit line (Converting the sections of the existing TL currently on wooden poles to steel lattice tower) With new 132/33kV 2x23MVA substation at Bamburi Cement. | Improve reliability and security of supply. Increase access, and connectivity through reinforcement of transmission grid. |
| 2025 | BOMANI | KILIFI | 132 | 29 | 29km, 132kV double circuit line (Converting the sections of the existing TL currently on wooden poles to steel lattice tower) with 132kV bay extension at Kilifi | Improve reliability and security of supply. Increase access, and connectivity through reinforcement of transmission grid |
| 2025 | NANYUKI-RUMURUTI UG CA | BLE | 132 | 14.5 | 14.5km of UG Cable along the Nanyuki-Rumuruti transmission line. | Extend transmission and reinforce distribution network - improve national access to electricity, upgrade voltage to improve supply quality, reduce system losses and increase system reliability. |
